

Jordan Calhoun

Technical GTM / Solutions Engineer — I build the working demo, run the funnel, and ship the implementation

jordanmercalhoun@gmail.com · GitHub: github.com/flt-sudo · Portfolio: [add link] · [City, ST]

SUMMARY

Full-stack builder who turns messy business workflows into shipped software — and then demos and sells it. I stand up branded product demos in hours from a reusable engine, instrument conversion funnels, and take real systems live: role-based portals, lead-capture pipelines, payments, and document generation on Next.js, React, TypeScript, Supabase/Postgres, and Stripe. I work the whole motion from discovery to demo to deploy, which is exactly what AI GTM engineering, demo/growth, and solutions roles require.

CORE SKILLS

GTM / Solutions: branded demo builds · one-command client scaffolding · instrumented funnels & conversion tracking · proposal & pricing scaffolding · discovery → architecture → deploy · technical onboarding **Full-Stack:** TypeScript/JavaScript · React · Next.js (App Router) · Node.js · Postgres schema design **Backend & Data:** Supabase (Postgres, Auth, Edge Functions) · Row-Level Security · multi-tenancy / RBAC **Integrations:** Stripe (payment links, webhooks) · Twilio SMS · Resend email · Vercel · GitHub Actions CI **AI-adjacent:** wiring AI-assisted features into real workflows · LLM prompt-cache cost analysis tooling

SELECTED PROJECTS

"Brightwater Home Services" — Repeatable Client Demo, built from a reusable engine

Next.js · React · Supabase (Postgres/Auth) · Vercel

- Stood up a complete, branded product demo — public marketing site + role-based operations portal + live lead→job pipeline — for a fictional home-services company, to prove a productized delivery system works for any small business.
- **Scaffolded the entire client (site, portal, database schema, 4-tier roles) from one command + a reusable engine**, then deployed it live against a seeded multi-location Postgres database — "a rebrand and a deploy, not a rebuild."
- Demonstrates the core GTM motion: a customer submits a request on the public site → it lands in the staff inbox → one click converts it to a scheduled, technician-assigned job, with branch-level access enforced at the database layer.

site-portal-starter — Productized SaaS Delivery Engine

Next.js · Supabase · Vercel · Node scaffolding

- Built the reusable "marketing site + internal portal + lead pipeline" engine behind the demo above — one codebase deployed per client.
- Wrote a **zero-dependency new-client scaffolding script** that spins up a branded demo branch, patches brand config, and generates proposal + market-research docs in one command.
- Documented and ran a full GTM motion: qualify → research → priced proposal → branded demo → ship.

markwatch — Live Growth Wedge with an Instrumented Funnel

Next.js · React · Supabase · Vercel Analytics

- Shipped a live free-tool wedge (a deadline calculator) designed to convert into a paid monitoring product.
- Built an **instrumented conversion funnel** — event tracking, lookup→signup capture, and a disciplined demand-test gate before building further. GTM thinking expressed in code.

Air Marshalls — Production Operations Portal (live: airmarshalls corporate.com)

Next.js 14 · Supabase · Vercel · Capacitor/iOS · CI

- Designed and shipped a **live** multi-tenant portal for a multi-branch franchise: public lead intake → job conversion, 4-tier role hierarchy enforced in 14 RLS-protected tables, and Edge Functions for user management. Proof I take demos all the way to production.

Flytline — Multi-Tenant SaaS (MVP)

Next.js 16 · TypeScript · Supabase · Twilio

- Built automatic scheduling-recovery via a rules-and-scoring matching engine, an 11-table multi-tenant schema (~80 RLS policies), and TCPA-compliant SMS automation.

Also: mosaic-eligible (deterministic lookup engine + Stripe) · plugready (compliance SaaS: PDF certs, QR verify, Stripe webhooks) · cachelens (OSS LLM prompt-cache cost analyzer).
