

Jordan Calhoun

Implementation & Solutions Engineer / Technical Customer Success — I take messy workflows live and make them usable

jordanmercalhoun@gmail.com · GitHub: github.com/flt-sudo · Portfolio: [add link] · [City, ST]

SUMMARY

Full-stack builder focused on getting real systems into customers' hands and keeping them running. I implement multi-tenant, role-based portals (one live in production), design onboarding and user-management flows, write the deploy and walkthrough docs non-technical staff actually use, and integrate the plumbing — auth, payments, email/SMS — with Next.js, React, TypeScript, Supabase/Postgres, and Stripe. Comfortable across discovery, configuration, rollout, and support.

CORE SKILLS

Implementation / CS: multi-tenant rollout · role & permission configuration · onboarding & invite flows · written deploy guides & end-user walkthroughs · regulated-domain care · troubleshooting **Full-Stack:** TypeScript/JavaScript · React · Next.js (App Router) · Node.js · Postgres schema design **Backend & Data:** Supabase (Postgres, Auth, Edge Functions) · Row-Level Security policy design · migrations **Integrations:** Stripe (payment links, webhooks) · Twilio SMS (consent/quiet-hours/audit) · Resend · Vercel · Capacitor/iOS · GitHub Actions CI

SELECTED PROJECTS

Air Marshalls — Production Operations Portal (*live: airmarshallscorporate.com*)

Next.js 14 · React · Supabase (Postgres/Auth/Edge Functions) · Vercel · Capacitor/iOS · CI

- Designed, shipped, and **deployed a live multi-tenant operations portal** for a multi-branch franchise, with a 4-tier role hierarchy (HQ → regional → branch manager → technician) enforced across 14 Row-Level-Security-protected tables.
- Built the customer-facing workflow end to end: public lead intake → job conversion → digital chain-of-custody forms with signature capture and auto-generated document numbers.
- Implemented **user administration** — invite/role/password Edge Functions, a privilege-escalation guard, and per-branch scoping — the configuration surface an implementation/CS role owns day to day.
- Authored a **repeatable 30–45 minute deploy guide** and added acceptance/RLS test suites + CI, so the system can be stood up and maintained reliably.

"Brightwater Home Services" — Repeatable Implementation Demo

Next.js · Supabase · Vercel

- Stood up a complete branded client system (marketing site + role-based portal + lead→job pipeline) from a reusable engine to show how fast a new customer can be onboarded — **scaffolded site, portal, schema, and 4-tier roles from one command**, then deployed live against a seeded multi-location database.
- Configured working logins across every role to demonstrate that access is correctly scoped per branch at the database layer — the kind of role setup and verification an implementation handoff requires.

Flytline — Multi-Tenant SaaS (*MVP*)

Next.js 16 · TypeScript · Supabase · Twilio

- Designed an 11-table multi-tenant schema with ~80 RLS policies across 4 roles, isolating every tenant at the database layer.
- Implemented **compliance-aware SMS automation** (consent, quiet-hours, rate-limit, audit trail) — the guardrails regulated customers require — plus operator dashboards quantifying business impact.

site-portal-starter — Productized Delivery Engine

Next.js · Supabase · Vercel · Node scaffolding

- Built the reusable engine behind the demos above, with a one-command client scaffolder and a documented delivery pipeline (research → proposal → branded demo → ship) — turning bespoke setups into a repeatable, supportable process.

Also: plugready (regulated compliance SaaS: PDF certificates, QR verification, Stripe webhooks, RLS) · mosaic-eligible (deterministic lookup engine + Stripe) · cachelens (OSS LLM prompt-cache cost analyzer).
